

Ashok Kularia

Managing Director
ANJ Turnkey Projects Pvt. Ltd

giving life to ideas!

and on-site execution. At ANJ, we approach it as an integrated discipline rather than an add-on. Material selection, sourcing partnerships, manufacturing methods, and waste management are planned together so environmental responsibility supports both delivery efficiency and design quality.

Our manufacturing ecosystem gives us greater control over quality, wastage, and material optimisation at scale. Looking ahead, sustainability will become a measurable performance metric, not a brand statement. Companies that embed it into operational systems will be better prepared for the future of workplace delivery.

With clients increasingly demanding environmentally conscious interiors, how is ANJ leveraging innovation in materials, waste reduction systems, design, and certifiable green solutions to reduce project footprints while maintaining design excellence and project speed?

The market expectation is now clear: sustainable interiors cannot come at the cost of design quality or project speed. Clients expect all three outcomes together. We are seeing stronger adoption of engineered materials, recycled-content substrates, low-VOC finishes, and modular systems that reduce site waste. Digital modelling and early-

stage coordination are also making a significant difference by improving quantity accuracy, reducing rework, and streamlining execution.

Transparency across the value chain is becoming equally important. Clients increasingly look for partners who demonstrate responsible sourcing and ethical practices. ANJ's assessment through EcoVadis strengthens visibility across environmental, labour, ethics, and procurement standards, reinforcing our commitment to measurable ESG performance.

By aligning design, manufacturing, and execution, sustainability becomes an integrated discipline rather than an add-on, enabling both environmental responsibility and delivery efficiency at scale.

Given ANJ's deep engagement with architects, suppliers, and contractors, what role does the company play in enabling ESG awareness, circular material use, and capability-building across the broader construction and interiors ecosystem, especially among MSME partners?

Sustainability cannot be achieved by one organization alone. It requires alignment across the ecosystem, especially as much of India's interiors sector depends on MSME partners. Our role is to act as an integrator by encouraging better practices, stronger awareness, and more responsible standards across the value chain. ■

How is ANJ integrating sustainability, responsible sourcing, and green construction practices into its turnkey design-build approach to create healthier, efficient, and future-ready workplaces?

Across the global workplace industry, sustainability has moved beyond certification and become a core business expectation. Today, occupiers evaluate workplaces through energy efficiency, embodied carbon, indoor environmental quality, and lifecycle durability. This shift is being shaped by tighter regulations as well as stronger ESG commitments across corporate real estate portfolios.

In India, the transition is accelerating. Clients are assessing materials, supply chains, and construction practices with far greater scrutiny. They want workplaces that are visually compelling, healthier for employees, and built responsibly.

For a design-build company, sustainability cannot remain confined to design intent alone. It must extend through procurement, manufacturing,
